

# Modeling two-nucleon knock-out in neutrino-nucleus scattering 

Kajetan Niewczas

Uniwersytet
Wrocławski

UNIVERSITEIT GENT

## Neutrino oscillation experiments

$$
P_{2 \mathrm{f}}\left(\nu_{\mu} \rightarrow \nu_{\mu}\right)=1-\sin ^{2}(2 \theta) \sin ^{2}\left(\frac{\Delta m^{2} L}{4 E_{\nu}}\right)
$$

$$
E_{\nu}^{\mathrm{rec}}=\frac{2\left(M_{n}-E_{B}\right) E_{\mu}-\left(E_{B}^{2}-2 M_{n} E_{B}+m_{\mu}^{2}\right)}{2\left[M_{n}-E_{B}-E_{\mu}+\left|\vec{k}_{\mu}\right| \cos \theta_{\mu}\right]}
$$

## Super-Kamiokande

## Detected rate of $\nu_{\alpha}$ events

$$
R_{\nu_{\alpha}} \sim \Phi_{\nu_{\mu}}\left(E_{\nu}\right) \times P_{\nu_{\mu} \rightarrow \nu_{\alpha}}\left(\{\Theta\}, E_{\nu}\right) \times \sigma_{\nu_{\alpha}}\left(E_{\nu}\right) \times \epsilon_{\operatorname{det}} .
$$

$$
\begin{array}{lllll}
\text { Event rate } & \text { Incoming flux } & \text { Oscillation probability } & \text { Cross section } & \text { Efficiency } \\
\hline
\end{array}
$$

Knowledge of neutrino-nucleus cross sections:
$\rightarrow$ allows to reconstruct neutrino energy from the detected final states,
$\rightarrow$ is the crucial uncertainty in oscillation analyses,
but...
$\rightarrow$ is an advanced computational problem,
$\rightarrow$ current precision is not exceeding $20 \%$,
$\rightarrow$ constraints from ND are not enough.
K. Abe et al., Phys.Rev.Lett. 121 (2018) 171802 (edited)

## Nuclear response

Coherent

T. Van Cuyck

## Dimensionality of the problem

$$
4 \text { four-vectors = } 16 \text { variables }
$$

- 4 : on-shell relations
- 4 : 4-mom. conservation
- 3 : nucleon rest frame
- 2 : neutrino along $\hat{z}$
any binary scattering with on-shell particles
3 independent variables
$\rightarrow$ we can fix incoming energy $\left(E_{\nu}\right)$
$\rightarrow$ the cross section is rotationally invariant $\left(\phi_{\mu}\right)$
$\rightarrow$ the final formula is 1 -dimensional, e.g. $\mathrm{d} \sigma / \mathrm{d} q^{2}$

## Dimensionality of the problem

scatterings including an off-shell target

3 independent variables

+ 3 : nucleus rest frame
+ 1 : off-shell nucleon

## 7 independent variables

+ 3 : every on-shell particle
$\rightarrow$ we can fix incoming energy $\left(E_{\nu}\right)$
$\rightarrow$ the cross section is rotationally invariant $\left(\phi_{\mu}\right)$
$\rightarrow$ the final formula is at least 5-dimensional

## Computing $\nu A$ cross section

## Monte Carlo generator

$\rightarrow$ generate events
$\rightarrow$ cover whole phase space
$\rightarrow$ useful but approximated
e.g. NuWro

Detailed calculation
$\rightarrow$ compute cross sections
$\rightarrow$ fixed kinematics
$\rightarrow$ precise but expensive
e.g. Ghent group

## The MiniBooNE puzzle

An attempt to make a pure CCQE measurement...

## The MiniBooNE puzzle

An attempt to make a pure CCQE measurement...
$\rightarrow$ suffered from huge model dependencies

L. Alvarez-Ruso, Nucl.Phys.B Proc.Suppl. 229-232 (2012) 167-173 (Neutrino 2010)

## The theoretical framework: language of response functions

## Cross section formula

CC $\nu A$ scattering

EM eA scattering

Currents:

$$
\begin{aligned}
\mathcal{J}_{\mu}^{\text {lep }}(q) & \equiv \bar{u}\left(k_{f}, s_{f}\right) \hat{J}_{\mu}^{\text {lep }} u\left(k_{i}, s_{i}\right)=\bar{u}\left(k_{f}, s_{f}\right) \gamma_{\mu}\left(1+h \gamma^{5}\right) u\left(k_{i}, s_{i}\right) \\
\mathcal{J}_{\mu}^{\text {nuc }}(q) & \equiv\left\langle\Psi_{f}\right| \hat{J}_{\mu}^{\text {nuc }}\left|\Psi_{i}\right\rangle
\end{aligned}
$$

where $h=0$ for (unpolarized) electrons, and $h=-(+)$ for (anti)neutrinos

## Cross section formula

CC $\nu A$ scattering

EM eA scattering

Matrix elements:

$$
\begin{aligned}
\mathcal{M}_{f i}^{W} & =-i \frac{G_{F}}{\sqrt{2}} \cos \theta_{c} \mathcal{J}_{\nu}^{\mathrm{lep}}(q) \mathcal{J}_{\text {nuc }}^{\nu}(q) \\
\mathcal{M}_{f i}^{\gamma} & =-i \frac{e^{2}}{Q^{2}} \mathcal{J}_{\nu}^{\mathrm{lep}}(q) \mathcal{J}_{\text {nuc }}^{\nu}(q)
\end{aligned}
$$

## Cross section formula

CC $\nu A$ scattering

EM eA scattering

The cross section is propotional to the square:

$$
\begin{aligned}
{\overline{\sum_{i f}}}\left|\mathcal{M}_{f i}^{W}\right|^{2} & =\frac{G_{F}^{2}}{2} \cos ^{2} \theta_{c} L_{\mu \nu} H^{\mu \nu} \\
{\overline{\sum_{i f}}}\left|\mathcal{M}_{f i}^{\gamma}\right|^{2} & =\frac{e^{4}}{4 Q^{2}} L_{\mu \nu} H^{\mu \nu}
\end{aligned}
$$

## Cross section formula

CC $\nu A$ scattering
EM eA scattering

Leptonic tensor:
$L_{\mu \nu} \propto\left(k_{i, \mu} k_{f, \nu}+k_{f, \nu} k_{i, \mu}+g_{\mu \nu} m_{i} m_{f}-g_{\mu \nu} k_{i} \cdot k_{f}-i h \epsilon_{\mu \nu \alpha \beta} k_{i}^{\alpha} k_{f}^{\beta}\right)$
the axial term $\left(-i h \epsilon_{\mu \nu \alpha \beta} k_{i}^{\alpha} k_{f}^{\beta}\right)$ drops down for electrons $(h=0)$

## Cross section formula

In such frame of reference:

$$
\begin{gathered}
L_{\mu \nu} W^{\mu \nu}=\frac{2 \epsilon_{i} \epsilon_{f}}{m_{i} m_{f}} \quad\left[v_{C C} W_{C C}+v_{C L} W_{C L}+v_{L L} W_{L L}+v_{T} W_{T}+v_{T T} W_{T T}+v_{T C} W_{T C}\right. \\
\left.+v_{T L} W_{T L}+h\left(v_{T^{\prime}} W_{T^{\prime}}+v_{T C^{\prime}} W_{T C^{\prime}}+v_{T L^{\prime}} W_{T L^{\prime}}\right)\right]
\end{gathered}
$$

## Lepton responses

$$
\begin{aligned}
& v_{C C}=1+\zeta \cos \theta \\
& v_{C L}=-\left(\frac{\omega}{q}(1+\zeta \cos \theta)+\frac{m_{f}^{2}}{\epsilon_{f} q}\right) \\
& v_{L L}=1+\zeta \cos \theta-\frac{2 \epsilon_{i} \epsilon_{f}}{q^{2}} \zeta^{2} \sin ^{2} \theta \\
& v_{T}=1-\zeta \cos \theta+\frac{\epsilon_{i} \epsilon_{f}}{q^{2}} \zeta^{2} \sin ^{2} \theta \\
& v_{T T}=-\frac{\epsilon_{i} \epsilon_{f}}{q^{2}} \zeta^{2} \sin ^{2} \theta
\end{aligned}
$$

$$
\begin{aligned}
v_{T C} & =-\frac{\sin \theta}{\sqrt{2} q} \zeta\left(\epsilon_{i}+\epsilon_{f}\right) \\
v_{T L} & =\frac{\sin \theta}{\sqrt{2} q^{2}} \zeta\left(\epsilon_{i}^{2}-\epsilon_{f}^{2}+m_{f}^{2}\right) \\
v_{T^{\prime}} & =\frac{\epsilon_{i}+\epsilon_{f}}{q}(1-\zeta \cos \theta)-\frac{m_{f}^{2}}{\epsilon_{f} q} \\
v_{T C^{\prime}} & =-\frac{\sin \theta}{\sqrt{2}} \zeta \\
v_{T L^{\prime}} & =\frac{\omega}{q} \frac{\sin \theta}{\sqrt{2}} \zeta
\end{aligned}
$$

$\rightarrow$ dimensionless kinematical factors

## One-nucleon knockout

$$
\frac{\mathrm{d} \sigma}{\mathrm{~d} E_{l^{\prime}} \mathrm{d} \Omega_{l^{\prime}}}=4 \pi \sigma^{x} \zeta f_{r e c}^{-1}\left[v_{C C} W_{C C}+v_{C L} W_{C L}+v_{L L} W_{L L}+v_{T} W_{T}+h v_{T^{\prime}} W_{T^{\prime}}\right]
$$ with $v_{i}$ and $\sigma^{X}$ containing leptonic information, e.g.

$$
\sigma^{\mathrm{Mott}}=\left(\frac{\alpha \cos \left(\theta_{e^{\prime}} / 2\right)}{2 E_{e} \sin ^{2}\left(\theta_{e^{\prime}} / 2\right)}\right)^{2}, \quad \sigma^{W}=\left(\frac{G_{F} \cos \theta_{c} E_{\mu}}{2 \pi}\right)^{2}
$$

and the response functions $W_{i}$ containing the nuclear information

$$
\begin{aligned}
W_{C C} & =\left|\mathcal{J}_{0}\right|^{2} \\
W_{C L} & =2 \Re\left(\mathcal{J}_{0} \mathcal{J}_{3}^{\dagger}\right) \\
W_{L L} & =\left|\mathcal{J}_{3}\right|^{2} \\
W_{T} & =\left|\mathcal{J}_{+}\right|^{2}+\left|\mathcal{J}_{-}\right|^{2} \\
W_{T^{\prime}} & =\left|\mathcal{J}_{+}\right|^{2}-\left|\mathcal{J}_{-}\right|^{2}
\end{aligned}
$$

$$
\begin{aligned}
\mathcal{J}_{0} & =\left\langle\Psi_{\mathrm{f}}\right| \hat{\jmath}_{0}(q)\left|\Psi_{\mathrm{i}}\right\rangle \\
\mathcal{J}_{+} & =\left\langle\Psi_{\mathrm{f}}\right| \hat{\jmath}_{+}(q)\left|\Psi_{\mathrm{i}}\right\rangle \\
\mathcal{J}_{-} & =\left\langle\Psi_{\mathrm{f}}\right| \hat{\jmath}_{-}(q)\left|\Psi_{\mathrm{i}}\right\rangle \\
\mathcal{J}_{3} & =\left\langle\Psi_{\mathrm{f}}\right| \hat{\jmath}_{3}(q)\left|\Psi_{\mathrm{i}}\right\rangle
\end{aligned}
$$

## Two-nucleon knockout

$$
\begin{aligned}
& \frac{\mathrm{d} \sigma}{\mathrm{~d} E_{\prime^{\prime}} \mathrm{d} \Omega_{\prime^{\prime}} \mathrm{d} T_{a} \mathrm{~d} \Omega_{a} \mathrm{~d} \Omega_{b}}=\sigma^{\chi} \zeta g_{r e c}^{-1} \\
& \times\left[v_{C C} W_{C C}+v_{C L} W_{C L}+v_{L L} W_{L L}+v_{T} W_{T}+v_{T T} W_{T T}+v_{T C} W_{T C}\right. \\
& \left.\quad+v_{T L} W_{T L}+h\left(v_{T^{\prime}} W_{T^{\prime}}+v_{T C^{\prime}} W_{T C^{\prime}}+v_{T L^{\prime}} W_{T L^{\prime}}\right)\right],
\end{aligned}
$$

$$
\begin{aligned}
& W_{T T}=2 \Re\left(\mathcal{J}_{+} \mathcal{J}_{-}^{\dagger}\right) \\
& W_{T C}=2 \Re\left(\mathcal{J}_{0}\left(\mathcal{J}_{+}-\mathcal{J}_{-}\right)^{\dagger}\right) \mathcal{J}_{0}=\left\langle\Psi_{\mathrm{f}}\right| \widehat{J}_{0}(q)\left|\Psi_{\mathrm{i}}\right\rangle \\
& W_{T L}=2 \Re\left(\mathcal{J}_{3}\left(\mathcal{J}_{+}-\mathcal{J}_{-}\right)^{\dagger}\right) \mathcal{J}_{+}=\left\langle\Psi_{\mathrm{f}}\right| \widehat{J}_{+}(q)\left|\Psi_{\mathrm{i}}\right\rangle \\
& W_{T C^{\prime}}=2 \Re\left(\mathcal{J}_{0}\left(\mathcal{J}_{+}+\mathcal{J}_{-}\right)^{\dagger}\right) \mathcal{J}_{-}=\left\langle\Psi_{\mathrm{f}}\right| \widehat{J}_{-}(q)\left|\Psi_{\mathrm{i}}\right\rangle \\
& W_{T L^{\prime}}=2 \Re\left(\mathcal{J}_{3}\left(\mathcal{J}_{+}+\mathcal{J}_{-}\right)^{\dagger}\right) \mathcal{J}_{3}=\left\langle\Psi_{\mathrm{f}}\right| \widehat{J}_{3}(q)\left|\Psi_{\mathrm{i}}\right\rangle \\
&
\end{aligned}
$$

$\rightarrow$ integrate over outgoing nucleons $\int \mathrm{d} T_{a} \mathrm{~d} \Omega_{a} \mathrm{~d} \Omega_{b}$

## The theoretical framework: nuclear modeling

## Nuclear model: initial state

- Ground state nucleus is an independent-particle model (IPM)
- Mean-field potential results in a shell model
- Calculated with a Hartree-Fock (HF) approximation using a Skyrme NN force (SkE2)
- Accounts for binding energies and nuclear structure

## Nuclear model: initial state

$\rightarrow$ we iteravitely solve a radial Schrödinger equation for $R_{l j m}$

$\rightarrow$ carbon wave functions for particular shells

## Nuclear model: final state

- Continuum wave functions are calculated using the same NN potential
- Orthogonality is preserved between initial and final states
- Distortion effects of the residual nucleus on the ejected nucleons are incorporated
- Pauli-blocking effects included inherently

## Multipole expansion

$\rightarrow$ we perform non-relativistic reduction of operators
$\rightarrow$ simplify integrals with multipole expansion

$$
\begin{aligned}
& \hat{\rho}(\mathbf{q}) \rightarrow \hat{M}_{J M}^{\mathrm{Coul}}(q)=\int \mathrm{d} \mathbf{r}\left[j_{J}(q r) Y_{J M}\left(\Omega_{r}\right)\right] \hat{\rho}(\mathbf{r}) \\
& \hat{J}_{3}(\mathbf{q}) \rightarrow \hat{L}_{J M}^{\text {long }}(q)=\frac{i}{q} \int \mathrm{~d} \mathbf{r}\left[\nabla\left(j_{J}(q r) Y_{J M}\left(\Omega_{r}\right)\right)\right] \cdot \hat{J}(\mathbf{r}) \\
& \hat{J}_{ \pm}(\mathbf{q}) \rightarrow \hat{T}_{J M}^{\text {elec }}(q)=\frac{1}{q} \int \mathrm{~d} \mathbf{r}\left[\nabla \times\left(j_{J}(q r) \mathbf{Y}_{J(J, q)}^{M}\left(\Omega_{r}\right)\right)\right] \cdot \hat{J}(\mathbf{r}) \\
& \rightarrow \hat{T}_{J M}^{\mathrm{magn}}(q)=\int \mathrm{d} \mathbf{r}\left[j_{J}(q r) \mathbf{Y}_{J(J, q)}^{M}\left(\Omega_{r}\right)\right] \cdot \hat{J}(\mathbf{r})
\end{aligned}
$$

$\rightarrow$ summation over $J$ increases the accuracy of our results

Nuclear currents in the IA

$$
\begin{aligned}
\hat{\rho}_{V}(\mathbf{r}) & =\sum_{i}^{A} F_{1}\left(Q^{2}\right) \delta^{(3)}\left(\mathbf{r}-\mathbf{r}_{i}\right) \tau_{ \pm}(i) \\
\hat{\rho}_{A}(\mathbf{r}) & =\sum_{i}^{A} \frac{G_{A}\left(Q^{2}\right)}{2 m_{N} i} \sigma_{i} \cdot\left[\delta^{(3)}\left(\mathbf{r}-\mathbf{r}_{i}\right) \vec{\nabla}_{i}-\overleftarrow{\nabla}_{i} \delta^{(3)}\left(\mathbf{r}-\mathbf{r}_{i}\right)\right] \tau_{ \pm}(i) \\
\hat{J}_{V}(\mathbf{r}) & =\hat{J}_{\mathrm{Con}}(\mathbf{r})+\hat{J}_{\operatorname{mag}}(\mathbf{r}) \\
& =\sum_{i}^{A} \frac{F_{1}\left(Q^{2}\right)}{2 m_{N} i^{i}}\left[\delta^{(3)}\left(\mathbf{r}-\mathbf{r}_{i}\right) \vec{\nabla}_{i}-\overleftarrow{\nabla}_{i} \delta^{(3)}\left(\mathbf{r}-\mathbf{r}_{i}\right)\right] \tau_{ \pm}(i) \\
& +\sum_{i}^{A} \frac{F_{1}\left(Q^{2}\right)+F_{2}\left(Q^{2}\right)}{2 m_{N}}\left(\vec{\nabla} \times \sigma_{i}\right) \delta^{(3)}\left(\mathbf{r}-\mathbf{r}_{i}\right) \tau_{ \pm}(i) \\
\hat{J}_{A}(\mathbf{r}) & =\sum_{i}^{A} G_{A}\left(Q^{2}\right) \delta^{(3)} \sigma_{i}\left(\mathbf{r}-\mathbf{r}_{i}\right) \tau_{ \pm}(i)
\end{aligned}
$$

## One-nucleon knockout

$\rightarrow$ multipoles contribution

$\rightarrow$ comparison to electron scattering data

## Short-range correlations

Fat tails in the single-nucleon momentum distribution cannot be explained within an independent-particle model (IPM)
Log(Momentum distribution)
$\rightarrow$ Nucleons occur in pairs with high relative momenta and low center-of-mass momenta (SRC pairs)
$\rightarrow$ Mean-field: momenta below $k_{F}$, SRC pairs: momenta above $k_{F}$
$\rightarrow$ A signature of SRC is back-to-back $2 N$ knockout
$\rightarrow$ SRC also have an effect on $1 N$ knockout

## Short-range correlations

- The correlations have a short range: $f\left(r_{i j}\right) \rightarrow 0$ at $r_{i j}>3 \mathrm{fm}$
- Tensor correlation function dominates for intermediate relative momenta $200-400$ $\mathrm{MeV} / \mathrm{c}$
- Central correlation function dominates at high relative momenta
- Spin-isospin correlation function overall relatively small
- These correlation functions are input
(Gearhart, 1994), (Pieper, Wiringa, and Pandharipande, 1992)

## Short-range correlations

Single-nucleon momentum distribution
J.Phys.G 42 (2015) 5, 055104

## Short-range correlations

Correlated wave functions $|\Psi\rangle$ are constructed by acting with a many-body correlation operator $\widehat{\mathcal{G}}$ on the uncorrelated Hartree-Fock wave functions $|\Phi\rangle$

$$
|\Psi\rangle=\frac{1}{\sqrt{\mathcal{N}}} \widehat{\mathcal{G}}|\Phi\rangle, \quad \text { with } \quad \mathcal{N}=\langle\Phi| \widehat{\mathcal{G}}^{\dagger} \widehat{\mathcal{G}}|\Phi\rangle
$$

The central ( $c$ ), tensor $(t \tau)$ and spin-isospin ( $\sigma \tau$ ) correlations are responsible for majority of the strength

$$
\widehat{\mathcal{G}} \approx \widehat{\mathcal{S}}\left(\prod_{i<j}^{A}[1+\widehat{l}(i, j)]\right)
$$

with $\widehat{\mathcal{S}}$ the symmetrization operator and

$$
\hat{I}(i, j)=-g_{c}\left(r_{i j}\right)+f_{t \tau}\left(r_{i j}\right) \widehat{S}_{i j}\left(\vec{\tau}_{i} \cdot \vec{\tau}_{j}\right)+f_{\sigma \tau}\left(r_{i j}\right)\left(\vec{\sigma}_{i} \cdot \vec{\sigma}_{j}\right)\left(\vec{\tau}_{i} \cdot \vec{\tau}_{j}\right) .
$$

$g_{c}\left(r_{i j}\right), f_{t \tau}\left(r_{i j}\right)$ and $f_{\sigma \tau}\left(r_{i j}\right)$ are the respective correlation functions
Correlation functions: (Gearhart, 1994), (Pieper, Wiringa, and Pandharipande, 1992)

## Short-range correlations

Transition matrix elements between correlated states $|\Psi\rangle$ can be written as ones between uncorrelated states $|\Phi\rangle$, with an effective transition operator

$$
\left\langle\Psi_{f}\right| \widehat{J}_{\mu}^{\mathrm{nucl}}\left|\Psi_{i}\right\rangle=\frac{1}{\sqrt{\mathcal{N}_{i} \mathcal{N}_{f}}}\left\langle\Phi_{f}\right| \widehat{J}_{\mu}^{\mathrm{eff}}\left|\Phi_{i}\right\rangle
$$

with

$$
\widehat{J}_{\mu}^{\text {eff }}=\widehat{\mathcal{G}}^{\dagger} \widehat{J}_{\mu}^{\text {nucl }} \widehat{\mathcal{G}}=\left(\prod_{j<k}^{A}[1+\widehat{l}(j, k)]\right)^{\dagger} \widehat{J}_{\mu}^{\text {nucl }}\left(\prod_{l<m}^{A}[1+\widehat{l}(l, m)]\right) .
$$

In the IA, the many-body nuclear current can be written as a sum of one-body operators

$$
\widehat{J}_{\lambda}^{\mathrm{eff}}=\left(\prod_{j<k}^{A}[1+\widehat{l}(j, k)]\right)^{\dagger} \sum_{i=1}^{A} \widehat{\jmath}_{\lambda}^{[1]}(i)\left(\prod_{l<m}^{A}[1+\widehat{l}(l, m)]\right) .
$$

## Short-range correlations

Use the fact that SRC is a short-range phenomenon
$\rightarrow$ Terms linear in the correlation operator are retained
$\rightarrow$ A-body operator $\rightarrow$ 2-body operator

$$
\widehat{\jmath}_{\lambda}^{\text {eff }} \approx \underbrace{\sum_{i=1}^{A} \widehat{\jmath}_{\lambda}^{[1]}(i)}_{\text {one-body(IA) }}+\underbrace{\sum_{i<j}^{A} \widehat{\jmath}_{\lambda}^{[1], \text { in }}(i, j),+\left[\sum_{i<j}^{A} \widehat{\jmath}_{\lambda}^{[1], \text { in }}(i, j)\right]^{\dagger}}_{\text {two-body (SRC) }}
$$

where

$$
\widehat{J}_{\lambda}^{[1], \text {,in }}(i, j)=\left[\widehat{J}_{\lambda}^{[1]}(i)+\widehat{J}_{\lambda}^{[1]}(j)\right] \widehat{\jmath}(i, j)
$$

$\rightarrow$ Effective nuclear current is the sum of a one-body (IA) and two-body (SRC) current

## Short-range correlations

The 1p1h (top) and 2p2h (bottom) diagrams considered. The top left diagram shows the 1p1h channel in the IA.

## SRC results - Inclusive ${ }^{12} \mathrm{C}\left(\nu_{\mu}, \mu^{-}\right)$

$\rightarrow$ Small decrease of $1 p 1 h$ channel due to SRCs
$\rightarrow$ Inclusive $2 p 2 h$ appears as a broad background to $1 p 1 h$

## Meson-exchange currents

The seagull and pion-in-flight currents.

## Meson-exchange currents

The $\Delta$ currents (top) and correlation currents (bottom).

## MEC results - Inclusive ${ }^{12} \mathrm{C}\left(\nu_{\mu}, \mu^{-}\right)$

$\rightarrow$ Small increase of $1 p 1 h$ channel due to MECs
$\rightarrow$ Inclusive $2 p 2 h$ appears as a broad background to $1 p 1 h$

## SRS + MEC

## Extend the current model with MECs

## SRC + MEC results - Inclusive ${ }^{12} \mathrm{C}\left(\nu_{\mu}, \mu^{-}\right)$

$\rightarrow$ Effect of MECs largest for small $\theta_{\mu}$, SRCs for larger $\theta_{\mu}$ in $1 p 1 h$ channel
$\rightarrow$ Inclusive $2 p 2 h$ appears as a broad background to $1 p 1 h$

## Comparison with MiniBooNE data

MiniBooNE 'CCQE-like' data from Phys.Rev.D 81 (2010) 092005

CRPA results are from Phys.Rev.C 94 (2016) 054609

## Comparison with T2K data

CRPA results are from Phys.Rev.C 94 (2016) 054609

## Exclusive $A\left(\nu_{\mu}, \mu^{-} N_{a} N_{b}\right)$

$\mathrm{d} \sigma / \mathrm{d} \epsilon_{\mu} \mathrm{d} \Omega_{\mu} \mathrm{d} T_{a} \mathrm{~d} \Omega_{a} \mathrm{~d} \Omega_{b}\left(10^{-45} \mathrm{~cm}^{2} / \mathrm{MeV}^{2}\right)$

The ${ }^{12} \mathrm{C}\left(\nu_{\mu}, \mu^{-} N_{a} N_{b}\right)$ cross section at $\epsilon_{\nu_{\mu}}=750 \mathrm{MeV}, \epsilon_{\mu}=550 \mathrm{MeV}, \theta_{\mu}=15^{\circ}$ and $T_{\mathrm{p}}=50 \mathrm{MeV}$ for in-plane kinematics $\left(q=268 \mathrm{MeV} / \mathrm{c}, x_{B}=0.08\right)$. The bottom panel shows $P_{12}<300 \mathrm{MeV} / \mathrm{c}$.

## Summary

$\rightarrow$ The Ghent group provides a powerful model capable of calculating various contributions to the 2 p 2 h final states
$\rightarrow$ The MEC calculation misses $\Delta$-currents and needs to be further developed
$\rightarrow$ Efforts are done to implement such model in Monte Carlo event generators so it can be used in experimental analyses
